Chapter 1

Introduction

This report presents our experience while delivering the IDP project presentation titled **GetHired**. The objective of this report is to document the overall presentation process, the sequence in which the project was explained, and the experience gained during the evaluation.

The report highlights both the technical explanation of the system and the practical experience of presenting it in front of faculty members.

1.1 Project Overview

The GetHired system is a web-based recruitment platform designed to bridge the gap between job seekers and employers. It provides a centralized platform where users can search for jobs, apply for positions, and track their application status.

The system incorporates modern technologies such as:

- React for frontend development
- Flask for backend API services
- Relational database for data storage
- AI-based modules for resume analysis and job matching

The main goal of the system is to simplify and automate the recruitment process.

1.2 Presentation Flow

The presentation was organized in a structured manner to ensure clarity and logical progression of ideas. Each section of the project was explained step by step to help the audience understand both the concept and implementation.

1.3 Introduction Slide

We began the presentation by introducing the problem statement. We explained the challenges in traditional recruitment systems such as inefficiency, lack of transparency, and time consumption. This was followed by presenting our solution, GetHired, as a modern and efficient platform.

1.4 System Architecture

We explained the overall architecture of the system using a three-tier model:

- **Frontend Layer**: Developed using React, responsible for user interaction
- **Backend Layer**: Built with Flask, handling business logic and APIs
- **Data Layer**: Includes database and AI services for data processing

We also described how data flows between these layers through RESTful APIs.

1.5 Modules Explanation

We divided the system into major modules and explained each clearly:

- **Worker Module**: Job search, application submission, and tracking
- **Employer Module**: Job posting, managing applications, and candidate evaluation
- **Admin Module**: Monitoring users and managing system operations

This helped in demonstrating the role-based functionality of the system.

1.6 Live Demonstration

A live demonstration was conducted to showcase the working system. The following functionalities were demonstrated:

- User registration and login process
- Searching for jobs using filters
- Applying for a job
- Employer posting a job
- Updating application status

The demonstration helped in validating that the system works as intended.

1.7 Experience During Presentation

The presentation was a valuable and enriching experience. It provided us with an opportunity to present our technical work in a formal setting and improve our communication skills.

We were able to confidently explain the project and demonstrate its features effectively.

1.8 Positive Aspects

- Clear and well-structured explanation of the system
- Smooth execution of live demonstration
- Strong coordination among team members
- Good understanding of project concepts

1.9 Challenges Faced

- Managing time effectively during the presentation
- Handling unexpected technical questions
- Explaining AI-related features in a simple manner
- Ensuring smooth demo without technical issues

These challenges helped us improve our problem-solving and presentation skills.

1.10 Faculty Interaction

During the presentation, the faculty members asked insightful questions related to:

- System architecture and design decisions
- Database structure and relationships
- Implementation of AI features
- Future improvements of the system

We responded to the questions confidently and clarified our design choices and implementation approach.

1.11 Conclusion

The presentation was a significant learning experience. It helped us understand how to effectively present a technical project and communicate ideas clearly.

We gained confidence in explaining system design, handling questions, and demonstrating real-time functionality. This experience will be valuable for future academic and professional presentations.

1.12 Images (Geo-Tagged Evidence)

Below are the images captured during the presentation as proof of our participation and demonstration:

1.13 Future Improvements

The system can be further enhanced in the following ways:

- Improve user interface and user experience
- Integrate advanced AI models for better recommendations
- Develop a mobile application version

- Add real-time notifications and messaging features
- Deploy the system with scalable cloud infrastructure
